

Arthropod Trap

Q: What was the most popular arthropod in January?
 A: **Formicidae.**

Steps to Collect

1. Our fifth grade class had to choose the area where we were going to dig our arthropod traps.
2. Then our class had to go outside to measure the traps 7 meters apart.
3. After measuring, we started the digging of our traps.
4. When we finished digging the arthropod traps, we put 7 traps in the hole we wanted approximately for 12 hours.
5. Then we went and collected the traps that contained our arthropods.
6. We put the arthropods into Ziploc bags and froze the arthropods for 48 hours.
7. After 48 hours we took them out of the freezer, and then had to classify the arthropods.
8. We collected the data and went into the classroom to count the data in the database.
